

# Strawberry Life Cycle

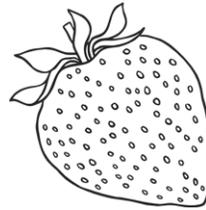

Color the pictures of the strawberry life cycle, cut them out, and stick them in the correct order.

The strawberry plant begins to sprout. Yellow and white flowers begin to grow from the plant.

The baby strawberry takes about four weeks to grow into a ripe, red strawberry, ready to be picked.

Each small yellow and white flower begins to grow a small, green, unripe strawberry.

Strawberry seeds are planted in soil and given water and sunlight. The seeds grow into a plant.
